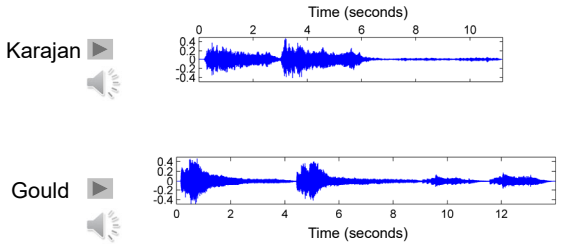
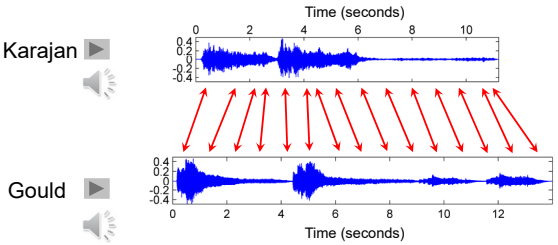
Music Synchronization: Audio-Audio

Beethoven's Fifth



Music Synchronization: Audio-Audio

Beethoven's Fifth



Application: Interpretation Switcher

Music Synchronization: Audio-Audio

Task

Given: Two different audio recordings (two versions) of the same underlying piece of music.

Goal: Find for each position in one audio recording the musically corresponding position in the other audio recording.

Music Synchronization: Audio-Audio

Traditional Engineering Approach:

1.) Feature extraction

- Robust to variations (e.g., instrumentation, timbre, dynamics)
- Discriminative (e.g., capturing harmonic, melodic, tonal aspects)

➡ **Chroma features**

2.) Temporal alignment

- Capturing local and global tempo variations
- Trade-off: Robustness vs. accuracy
- Efficiency

➡ **Dynamic time warping (DTW)**

Music Synchronization: Audio-Audio

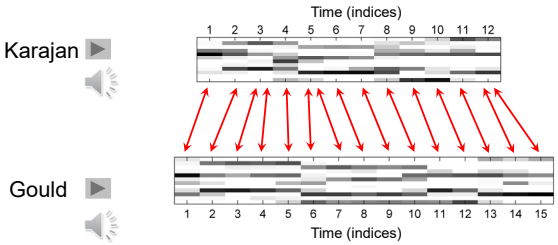
Optimal alignment (cost-minimizing warping path)



Music Synchronization: Audio-Audio

Deep Learning Approaches:

- Learn audio features from data
  - Should be able to achieve high alignment accuracy
  - Should be robust to performance variations
  - Musical relevance?
- Alignment problem
  - Pre-aligned data for training
  - Part of loss function → differentiability?

Audio Processing: Fourier Analysis

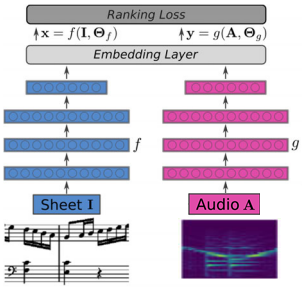
Music Synchronization: Image-Audio

Deep Learning Approach:



- Cross-modal embedding
- Requires corresponding snippets of audio and sheet music for training
- Triplet Loss function $\max(0, d(x^a, y^p) - d(x^a, y^n) + \alpha)$
- Problem very hard
  - Performance variations
  - Layout variations

Source Separation

- Decomposition of audio stream into different sound sources
- Central task in digital signal processing
- “Cocktail party effect”

Source Separation

- Decomposition of audio stream into different sound sources
- Central task in digital signal processing
- “Cocktail party effect”
- Several input signals
- Sources are assumed to be statistically independent

Source Separation (Music)

- Main melody, accompaniment, drum track
- Instrumental voices
- Individual note events
- Only mono or stereo
- Sources are often highly dependent

Informed Drum-Sound Decomposition

Major challenge: Reconstructed sound events often have artifacts

Approaches:

- Resynthesize certain sound components
- Differentiable Digital Signal Processing (DDSP) combines classical DSP and deep learning
- Generative adversarial networks may help to reduce the artifacts
