Chapter 7: Clustering and Analysis of Musical Styles

Corpus Analysis

Motivation

- Harmony analysis: individual pieces
- **Musical corpora:**
 - Closed set of pieces of a genre
 - Comprehensive set of pieces by a composer / artist
 - Representative set for a certain musical style
- **Corpus analysis:**
 - Analysis of individual pieces
 - **Aggregate** piece-wise results
 - **Visualize** results to see trends **on the large scale**

Corpus Analysis

Overview

Three example studies:

- Chord transitions in Western classical music
- Tonal complexity in Western classical music
- Tonal complexity in jazz solos

Chord transitions: Plagal vs. Authentic

- Authentic progressions: „falling“, „moving forward“, „directional“
- Plagal progressions: „opening“, „archaic“ („A-men“), colorful

Corpus Analysis

Overview

Three example studies:

- Chord transitions in Western classical music
- Tonal complexity in Western classical music
- Tonal complexity in jazz solos

Tonal Complexity: Jazz Solos

- Motivation: Corpus study on Western classical music
- „Evolution curves“ – tonal complexity over 300 years:

- What about jazz?

- Example: John Coltrane, Solo in *Giant Steps*

Music Scenario: Weimar Jazz Database (WJD)

- Jazz corpus comprising 456 jazz soli
- Used for our study:
 - High quality **symbolic** transcriptions of **solo melody**
 - **Audio** recordings of solo parts
- Corpus analysis :
 - **Evolution** of tonal complexity?

Tonal Complexity: Jazz Solos

- Compute tonal complexity from audio recordings
- **Individual solos** over recording year

Tonal Complexity: Jazz Solos

- Compute tonal complexity from audio recordings
- Add **mean complexity** for 20 most frequent soloists

Tonal Complexity: Jazz Solos

- Compute tonal complexity from audio recordings
- Add **evolution curve** for all solos

Corpus Analysis: Music Representations

- Compare all four representation types:

- Evolution curves have **different ranges**, but same **general trends**
- Corpus analysis can also be performed on **audio recordings**
